

Uh Oh!

- I want it to try some command related to grep, because we have to search with a format.
- Search online and found, “egrep” you can give a regular expression and it will search with it.
- I used the command `egrep '\([[:alnum:]]{3}\)[[:alnum:]]{3}\-[[:alnum:]]{4}' rockyou.txt -n`
- at the end use -n to know in what line the data was located it.
